Supplier Proposal / Request for Proposal Response

Orbit Digital

Experienced delivery team with strong references and integration ambiguity

1. Executive Summary and Understanding

Orbit highlights a long delivery history and customer references across digital transformation projects. The proposal provides a capable team profile but leaves some technical and integration details for the discovery phase.

Procurement Request

The buyer seeks a maintainable supplier solution with clear implementation milestones, integration readiness, transparent commercial assumptions, appropriate security controls, and dependable support. This fictional proposal is intended for classroom evaluation only.

2. Proposed Solution and Technical Approach

The proposal recommends a cloud-hosted web application with API-based connectivity and a central data store. It mentions scalable infrastructure and dashboards but does not specify the integration inventory, error-handling patterns, interface ownership, or load-test acceptance criteria. A technical workshop is required to finalize the design.

Operating assumptions

The customer will appoint a product owner, provide approved access to required systems, and review deliverables within agreed review windows. Scope changes will be documented and assessed before implementation.

Orbit Digital — Delivery and Commercials

3. Timeline, Team, and Milestones

A 14-week indicative timeline covers discovery, design, build, testing, and rollout. A senior delivery manager, technical lead, two developers, and QA engineer are proposed. Milestone dates depend on timely access to the customer's systems. The proposal includes weekly status reports but no detailed staffing allocation by phase.

Milestone	Expected evidence
Discovery	Approved requirements and dependency register
Design	Architecture and integration decisions
Build	Demonstrable features and code review
Validation	Test results, defects, and acceptance record
Launch	Training, handover, and operational readiness

4. Price Table and Assumptions

Indicative price: INR 36,50,000, excluding taxes. Includes project management, core application build, testing, and administrator training. Third-party licences, cloud infrastructure, extensive data cleansing, and integrations not confirmed in discovery are additional. The estimate is valid for 60 days.

All amounts and organizations in this document are fictional. Taxes and exclusions are stated as assumptions for evaluation practice, not as a commercial offer.

Orbit Digital — Risk, Security, and Support

5. Security, Compliance, and Risk Controls

Mentions role-based access, encrypted network traffic, backups, and audit logging. It does not specify encryption-at-rest configuration, formal security certification, penetration-testing frequency, incident notification deadlines, or detailed retention controls. Orbit is willing to complete a customer security questionnaire during due diligence.

Risk register excerpt

Potential risks include unclear integration ownership, delayed customer decisions, scope changes, and incomplete operational requirements. The supplier and buyer should confirm owners, likelihood, impact, mitigations, and acceptance evidence during discovery.

6. Support Model, Experience, and References

Offers 12 months of standard support with a named service manager, weekday coverage, and quarterly reviews. Critical response target is four business hours. The proposal summarizes four relevant digital delivery engagements and provides references on request. The escalation process is outlined, but service credits and resolution targets are not specified.

Reference note

Any references mentioned are fictional or generalized for this classroom exercise and do not represent actual clients. No real confidential supplier data is used.
